1) JAVA CODE

```
import java.util.Scanner;        // For user-input

public class ATMTransactionCounterEvangelista {
    public static void main(String[] args) {
        Scanner input = new Scanner(System.in);        // 'Scanner' is used to read user inputs
        int balance = 8000;        // the starting balance
        int menuChoice;        // For the ATM Menu choices
        int transactionCount = 0;        // Counter for the number of transaction. Initialized to 0.

        while (true) {        // Makes the loop continuous until user chooses 'Exit'.
            System.out.println();        // New space before showing the ATM menu
            // Displaying ATM Menu
            System.out.println("===== ATM Menu =====");
            System.out.println("1. Check Balance");
            System.out.println("2. Deposit");
            System.out.println("3. Withdraw");
            System.out.println("4. Exit");
            System.out.print("Enter choice: ");
            menuChoice = input.nextInt();        // To read the input number

            // Switchcase based on the menu choice
            switch (menuChoice) {
                case 1:        // Check Balance
                    transactionCount++;        // Transaction count increment
                    // Show the current balance (with the starting balance)
                    System.out.println("Balance = " + balance);
                    break;
```

```
case 2:     // Deposit
    transactionCount++;
    // Asking for the deposit amount (user- input)
    System.out.print("Enter deposit amount: ");
    int deposit = input.nextInt();
    balance = balance + deposit    //Adding deposit to balance
    System.out.println("New balance = " + balance);
    break;

case 3:     // withdraw
    transactionCount++;
    // Asking for withdrawal amount (user-input)
    System.out.print("Enter withdrawal amount: ");
    int withdraw = input.nexInt();
    // If-else statement to check if withdrawal is possible/allowed
    if (withdraw > balance) {
        System.out.println("Not enough balance.");
    } else if (withdraw > 2000) {     //Max amount to be withdrawn
        System.out.println("Maximum withdrawal is 2000 only.");
    } else {     // withdrawal is allowed
        balance = balance - withdraw;
        System.out.println("New balance = " + balance);
    }
    break;

case 4:     // Exit
    System.out.println("Transaction Count = " + transactionCount);
    System.out.println("thank you!");
    break;

default:    // If the input is outside choices
    System.out.println("Invalid choice!");
}

```
            //Exit loop if user input is 4
            if (menuChoice == 4) {
                break;
            }
        }
    }
}
```

2. SAMPLE EXECUTION

```
===== ATM MENU =====
1.Check Balance
2.Deposit
3.Withdraw
4. Exit
Enter choice: 1
Balance = 8000

===== ATM MENU =====
1.Check Balance
2.Deposit
3.Withdraw
4.Exit
Enter choice: 2
Enter deposit amount: 1000
New balance= 9000

===== ATM MENU =====
1.Check Balance
2.Deposit
3.Withdraw
4. Exit
Enter choice : 3
Enter withdrawal amount: 2000
New balance= 7000
```

→

```
===== ATM MENU =====
1.Check balance
2.Deposit
3.Withdraw
4.Exit
Enter choice: 4
Transaction count = 3
Thank you!
```

3. Short Explanation (3-5 sentences)

For the while loop, it makes the "ATM MENU" continuously show until the user chooses to exit, where an if handles it to break the loop. On the other hand, the switch-case is used to control the menu, depending on what the user will input, where in every input, the program runs the matching option or case. Lastly, the if-else statement in the withdraw part is there to validate whether the inputted amount is neither greater than the current balance, and not more than 2000 (maximum withdrawal amount). these three are used in the program to keep it running correctly.
